## **OLYMPIC GAMES MANAGERMENTS**

We aim to create a database management system in order to help the Olympic games committee to regulate the Olympic games which is a complex organization if it is wanted to be process smoothly.

Our database management will store information about the following entities; countries, athletes, managers, coaches, sponsorships, jury, press, medical service, technical service, transportation, audience, venue and competitions. When a member of Olympic committee enters the interface of our database, they will be able to reach out every piece of information that is required. Our additional purpose is that we want to display the relationships between these entities and their attributes.

For instance, some of the information that we can get from the database is that which transportation vehicle will transport athletes to the required venue or which country received how many medals from the games.
